Irvine, California February 15, 2006 – IMRON Corporation's authorized dealer NSI-Systems has just announced that they recently completed a large project to install IMRON's Open Architecture / Open Platform IS2000 at one of the California facilities of Western Digital, a leading storage products maker. The replacement and expansion project went as planned and included all parts of the existing system previously controlled by a large competitor's hardware and software product. The project also included expansion to provide new system features and capacity.

"The IS2000 is a perfect fit for this project", said a company spokesman for Imron Corporation, "we were able to convert all of their database, cards, and readers which saved Western Digital a lot of their original investment. Our OA / OP solution in place of the proprietary platform they had before will help them integrate this facility with others across the world".

"We're proud of our product and have made sure that the IS2000 truly Open Architecture / Open Platform can come right in and be the best choice for the client and the dealer", said Imron Hussain, company President and founder, "once again it's great to see the customer's excitement when they see what our system can do compared to the software it replaces."

The Open Architecture / Open Platform IS2000 is key to IMRON's authorized dealers' successes in replacing aging software at competitors' sites across the country. The IS2000 includes active alarm graphics, an organized database and easy to use graphical user controls. Many control systems once perceived as proprietary or obsolete can now be updated and maintained by using the IS2000 solution. Complete technical information is available at www.imron.com.

ABOUT IMRON Corporation -: Founded in 1997, IMRON Corporation is a major provider of Security Management Systems to brand name manufacturers around the world. Early products were first used by large-scale facilities to bridge the gap between separate systems from various manufacturers. These successes lead to the creation of private labeled systems and software for manufacturers to sell under their own brand names, providing integration solutions to large proprietary dealer groups. In 2003, IMRON Corporation expanded its operations to include complete system solutions direct to systems integrators, combining its state of the art software and field proven and reliable hardware in one value conscious package, the IS2000.

About Western Digital:- Western Digital, one of the storage industry's pioneers and long-time leaders, provides products and services for people and organizations that collect, manage and use digital information. Western Digital is a registered trademark of Western Digital Technologies, Inc. (www.westerndigital.com)
